

# Package ‘CQ2’

September 13, 2024

**Type** Package

**Title** Objective Calibration of Quick-Slow CQ Models and Baseflow

**Version** 0.1.0

**Author** Thomas Westfall, ORCID = ``0009-0000-0529-881X"

**Maintainer** Thomas Westfall <thomas.westfall11@monash.edu>

**Description** The CQ2 package evaluates a suite of C-Q models with single and multiple flow components on daily observations of streamflow and concentration. Models are globally calibrated with maximum likelihood estimation providing an objective estimate of baseflow in models with a slow-flow component. Calibrated models are compared to each other and alongside observations with various plots and metrics (AIC, NSE, RMSE). There are 15 C-Q models available (C1 - C15). The default analysis will compare C1, the simple C-Q model, and C13, a quick-slow version of the Hubbard Brook working model, that was the best performing at explaining the variability in the C-Q relationship. Derivations and explanations of each model are located in the following article: Westfall T.G., Peterson T.J., Lintern A., Western, A.W (2024), Slow and quick flow models explain the temporal dynamics of daily salinity in streams (IN PREP).

CQ2-package	Overview of methods and procedures
-------------	------------------------------------

---

**Description**

CQ2 fits and compares C-Q models with single flow components and slow-quick flow components on daily streamflow and concentration observations. The slow flow component in the multiple flow component C-Q models is estimated as baseflow using the Eckhardt (2005) baseflow filter, and the filter parameters are objectively calibrated along with model parameters using global optimization with the cmaesr (R-package). You have the option to run and evaluate any or all of the 15 models that are provided (Chat1 - Chat15), but the default analysis will compare Chat1, the simple C-Q model  $C = aQ^b$  and Chat13, a slow-quick version of the Hubbard Brook working model, that was the best performing at explaining the variation in C-Q plots. See the article when published: Westfall T.G., Peterson T.J., Lintern A., Western, A.W (2024), Slow and quick flow models explain the temporal dynamics of daily salinity in streams (IN PREP)

The CQ2 package operates by first setting up the data and models, `setModels`, then fitting the models, `runModels`. Be prepared to run models over lunch or overnight as the computation time for the slow-quick models can take several hours for 20+ year records of daily data. After computation, output the predictions from the models into a dataframe with `getResults`. Then the results can be evaluated through comparing the statistics (i.e. AIC, NSE, RMSE, BFI), `getStats`, parameters, `getParam`, or plot the predictions in C-Q scatter plots and annual timeseries along with observations and the objectively estimated baseflow, `plotResults`!

---

**I. Set-Up**

<code>setModels</code>	set-up data and C-Q models
------------------------	----------------------------

---

**II. Fit**

<code>runModels</code>	fit C-Q models
------------------------	----------------

---

**III. Review**

<code>getResults</code>	retrieve predictions from C-Q models
<code>plotResults</code>	plot predictions from C-Q models
<code>getStats</code>	retrieve performance of each C-Q model
<code>getParam</code>	retrieve parameters from C-Q models

---

**Authors**

Except where indicated otherwise, the methods and functions in this package were written by Thomas Westfall.

**Acknowledgments**

Immense gratitude to Tim Peterson, Anna Lintern, Andrew W. Western, and Lucas Pamminger for their assistance, patience, and support.

---

getParam	<i>Get Param</i>
----------	------------------

---

**Description**

getParam outputs the parameters for each fitted C-Q model

**Usage**

```
getParam(model.setup = list(), output.data = dataframe())
```

**Arguments**

model.setup	lists of details about data, model, and site from setModels
output.data	dataframe of daily concentration and baseflow predictions from getResults

**Details**

getParam  
exported dataframe with parameters from fitted C-Q models

**Value**

output summary dataframe with parameters for fitted models

---

getResults	<i>Get Results</i>
------------	--------------------

---

**Description**

getResults of fitted C-Q models

**Usage**

```
getResults(model.setup = list())
```

**Arguments**

model.setup	lists of details about data, model, and site from setModels()
cmaes.results	list of cmaes.results from fitted models

**Details**

getResults

exported predicted concentration and baseflow of fitted models

**Value**

output original data\_all dataframe with predicted concentration and baseflow of fitted models

---

getStats	<i>Get Stats</i>
----------	------------------

---

**Description**

getStats calculates the statistics for each fitted C-Q model

**Usage**

```
getStats(model.setup = list(), output.data = dataframe())
```

**Arguments**

model.setup	lists of details about data, model, and site from setModels
output.data	dataframe of daily concentration and baseflow predictions from getResults

**Details**

getStats

exported summary table with negLL, AIC, NSE, RMSE, and BFI

**Value**

output summary dataframe with statistics (negLL, AIC, NSE, RMSE, and BFI)

---

plotResults	<i>plot Results</i>
-------------	---------------------

---

**Description**

plotResults plots predictions from each fitted C-Q model

**Usage**

```
plotResults(
  model.setup = list(),
  output.data = data.frame(),
  plot.models = character(c()),
  plot.type = "scatter"
)
```

**Arguments**

<code>model.setup</code>	lists of details about data, model, and site from <code>setModels()</code>
<code>output.data</code>	dataframe of daily concentration and baseflow predictions from <code>getResults</code>
<code>plot.models</code>	character string vector with a 'C#' model name from provided models (i.e. C1-C15). Ch1 and C13 default. Two model limit.
<code>plot.type</code>	character string of either "scatter" or "timeseries" to view results. Note, 'time-series' exports plot as a pdf in the working directory

**Details**

`plotResults`  
 plots C-Q scatter plots and annual timeseries with predictions from fitted C-Q models

**Value**

annual timeseries plot comparing predictions from two models with observations, streamflow and baseflow; C-Q scatter plots of each model

---

<code>runModels</code>	<i>Run models</i>
------------------------	-------------------

---

**Description**

Run C-Q models for comparison

**Usage**

```
runModels(model.setup = list())
```

**Arguments**

<code>model.setup</code>	lists of details about data, model, and site from <code>setModels()</code>
--------------------------	--

**Details**

`runModels`  
 Runs C-Q models from the selection of Chat1-15. Default runs simple C-Q model (Chat1) and quick-slow Hubbard Brook model (Chat13)

**Value**

fitted C-Q models

setModels

*Set models***Description**

Set-up C-Q models for comparison

**Usage**

```
setModels(
  Chat.model.names = character(),
  input.data = data.frame(year = c(), month = c(), day = c(), C = c(), Q = c()),
  Qthresh = 0,
  Likelihood.name = "GaussLikelihood",
  site.id = character(),
  site.name = character()
)
```

**Arguments**

Chat.model.names	character string vector with a 'Chat#' model name from provided models (i.e. Chat1-Chat15). Chat1 and Chat13 default
input.data	dataframe of daily runoff and concentration. colnames = c("year", "month", "day", "C", "Q")
Qthresh	numeric low-flow streamflow threshold, models only fitted to observations with same day streamflow above this threshold.
Likelihood.name	character string with name of likelihood function ("GaussLikelihood", "GaussLikelihoodAR1", or "GaussLikelihoodAR3")
site.id	character string with identifier of gauge or catchment
site.name	character string with name of gauge or catchment

**Details**

setModels

Sets-up C-Q models from the selection of Chat1-15. Default sets-up simple C-Q model (Chat1) and quick-slow Hubbard Brook model (Chat13)

**Value**

C-Q models ready for runModels
